

A FreeBSD-based network simulation environment based on NS-3 and NSC

lastewart@swin.edu.au

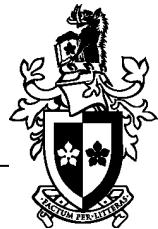

Centre for Advanced Internet Architectures (CAIA)
Swinburne University of Technology

Network Simulation Cradle (NSC)

- Specifies a consumer ↔ stack interface/API in sim/sim_interface.h
- Pre-existing FreeBSD 5, OpenBSD 3, Linux 2.6, LWIP, OMNeT stack ports
- Integrated with NS-2, NS-3 and OMNeT
- <https://secure.wand.net.nz/mercurial/nsc>

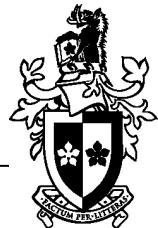

Network Simulator 3 (NS-3)

- Discrete event simulator (faster than real-time)
- Logical successor to the widely used NS-2
- Construct simulations in C++ or Python with arbitrary topologies based on existing OO models
- <http://code.nsnam.org/ns-3-dev>

CAIA's Contributions In A Nutshell

- Ported FreeBSD 9+10 network stacks to userspace
 - Socket to bottom of IP layers + infrastructure
- Wrapped with NSC C++ glue code to create NS-3 compatible dynamic library
- Better integrated NSC with NS-3
 - Socket upcalls, generic route manipulation, drive NSC stack off simulator virtual time, ...
- Extended NS-3 with models + simulations to support datacenter research
 - VOQ switch, Query/Response Application, TCP option support, generic dumbbell simulation, TCP incast simulation, ...

NS-3/NSC Uses

- Rapid prototyping in IP layer and above
- Regression testing
- Data networking research
- Teaching

Walkthrough + Demo

```
Istewart@Istewart-laptop> VBoxManage startvm --type  
headless freebsd9-amd64-caia-ns3-release
```

Waiting for VM "freebsd9-amd64-caia-ns3-release" to power on...

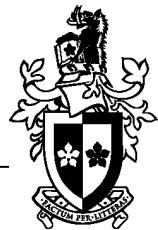

VM "freebsd9-amd64-caia-ns3-release" has been successfully started.

```
Istewart@Istewart-laptop> ssh -p2222 ns3@localhost
```
